LOOKING FOR 1–2 BUILDERS · META GLOBAL AI DEVELOPER HACKATHON · OCT 26 – NOV 4, 2026

Build SnapClaim with me

Indie track · solo founder seeking 1–2 collaborators · evenings IST · shipping starts today

TypeScript | Browser PWA | SAM 3.1 | Muse Spark | Open weights | 8-day sprint

> Hi, I'm **Parithosh** (**github.com/Parithosh-Varma**) — a self-taught TypeScript / browser / Cloudflare builder from India. I've got a live public repo, a full implementation plan, and eight days. I need one or two people to build and ship it with me.

1 The project — SnapClaim

Point a phone at damage, speak one line — get a claim-ready report where every number is measured, cited, and checked by an independent model before it ships.

```
📷 damage photo (+ coin / ruler for scale) + 🎙 voice note
      ↓
SAM 3.1 → pixel masks: crack / stain / peel / dent
      ↓
DETERMINISTIC MATH → area %, calibrated crack length, severity bands
      ↓
Muse Spark 1.3 → annexure text; every sentence must cite a measured number (EvidenceError
otherwise)
      ↓
Spark Open (open weights, Baseten) → independent skeptic re-measures;
            irreproducible findings print as DISPUTED
      ↓
Code-drawn SVG / PDF → masks over photo, receipts table, full replay
```

One-liner for judges: *"Computed, not generated — a claim is an argument, and arguments need evidence."* · Repo: **github.com/Parithosh-Varma/snapclaim** (implementation plan PDF in `docs/`).

2 Why this can place

- **Measured, not generated:** every number is computed from the pixels and replayable from a receipts file — a judge can verify a report live, on stage.
- **Felt problem:** deposit disputes, small claims, monsoon damage — the documentation people need and can't get.
- **Meta stack depth:** SAM 3.1 + Muse Spark + Spark Open + Muse Voice Transcribe — four Meta models with visibly distinct jobs.
- **Bonus coverage:** Best Open-Weights build (Spark Open skeptic), agentic workflow, and a genuinely meme-able clip: red masks blooming over a real crack, one finding flipping **DISPUTED**.

3 Who I'm looking for

ROLE	WHAT YOU'D OWN	NICE TO HAVE
CV / vision (1 slot)	SAM 3.1 prompting and mask quality, mask fusion, scale-reference calibration confidence	Python or TS · any segmentation experience · willing to test on real photos
Frontend / renderer / video (1 slot)	PWA capture flow, SVG/PDF report aesthetics, the 3-minute demo edit	Any web stack · design taste · CapCut / Resolve
Generalist (either slot)	Whatever's on fire — ship the loop end-to-end	You've shipped before; hackathon experience is a plus

4 Commitment & terms

- **~2–3 h/day**, evenings IST, **Oct 27 → Nov 4**; async-first, one 15-minute sync per day.
- **Trial first:** a 20-minute call + one small PR or issue before we commit to the team.
- **Prize split agreed in writing before submission.** Credits claimed individually via the official forms — no account sharing, no pooling.
- Code is public from Day 1; build logs are honest and dated in `DEV-LOG.md`.

5 What I bring

- The product spec, implementation plan, and public repo — ready before you reply.
- The deterministic pipeline design: evidence-gated findings, skeptic receipts, replayable reports.
- Browser / Cloudflare Worker engineering — I've shipped WebRTC file transfer, screen-recording agents, and a verify→score image-forensics pipeline.
- Meta credits claimed, spend discipline in place, and a plan that fits the 8 days.

How to reply: tell me **what you'd want to own** and **one thing you've shipped**. First reply gets the plan PDF and a call slot.
