SnapClaim — Tariq's checklist

Your lane: photos + demo + copy + admin. No code, no keys, no pushes. Tick by hand. Freeze Nov 2. Submit Nov 4 eve IST.

Job: wire the session store to D1

- [ ] State today: backend/store.ts is dead code — nothing imports it, D1StoreStub only throws. MemoryStore exists for Node/dev.
- [ ] 1. store.ts: add D1Store on the DB binding (id TEXT PK, at TEXT, findings INTEGER, mode TEXT). Keep MemoryStore. Prod path never throws (fallback or honest 501).
- [ ] 2. app.ts: POST /v1/sessions saves {id, at, findings, mode} — JSON only, no photo bytes, 400 on bad body. GET /v1/sessions lists latest 50. Both enveloped.
- [ ] 3. wrangler.toml: document the d1 binding (commented until DB exists) + migrations/0001_sessions.sql.
- [ ] 4. Tests (tests/store.test.ts): MemoryStore round-trip, 50-cap, 400s on bad body, D1 path stubbed. Full suite green.
- [ ] 5. Acceptance: tsc clean, npm test green, npm run eval 2 pass, $0 spend, no keys, no photo bytes in store.
- [ ] 6. Local-first: wrangler dev / miniflare D1 emulation only. No prod writes, no secret puts, no deploys without explicit order.
- [ ] 7. Ship as a PR branch against main. Parithosh reviews + deploys.

Do NOT touch

- [ ] No PWA code (pwa/) — UI freeze active.
- [ ] No evidence gate (src/findings/) or spend guard (src/config/spend-guard.ts) internals.
- [ ] No SAM / transcribe / skeptic providers (blocked lanes, not manpower tasks).
- [ ] No eval/ (Constantine's lane). No .env, no API keys, no account secrets.
- [ ] No site/ or promo/ edits in this PR — keep it backend-only.

Verify commands

- [ ] ./node_modules/.bin/tsc --noEmit (must be clean)
- [ ] npm test (40 green baseline — keep it green)
- [ ] npm run eval (2 pass baseline — keep it passing)
- [ ] npx wrangler dev (backend dir, local D1 emulation)
- [ ] git status first; commit on branch; push branch only, never main direct.
